Urinal flush valve is a valve mainly used for flushing toilets, water closet or other wash rooms. It is sorted to four styles, such as: manual, pressure, automatic and foot pedal flush valves by its different functions.

Now, please let me introduce these four styles toilet flush valves to you. So you can decide which style you want most. Firstly, manual flush valve is most common in our lives. It equipped a self-cleaning filtering system and a standard manual mechanical override button must be pushed by hand before flush. Pressure flush valve controls flows in flush system by pressure. It can keeps water at a constant pressure and temperature when the toilet flushes or the dishwasher runs through pressure balance. The super valve is automatic flusher valve . It with adjustable sensor eyes and low batter indicator light can adjust flow rate and flush automatically in sensor distance when we leave the basin or toilet. About foot pedal flush valves , you can flush the toilet without bending or straining and simply step on the foot flush pedal. It's a safer and easier way to flush. Our flush valves- concealed flush valve, urinal flush valve, toilet flush valves, inlet valve, automatic flush valve, foot pedal flush valves, manual flush valve, fill valve, pressure flush valve and mechanical flush valve commit to ultimate sanitary protection
